## **Preventing post-disaster PTSD: Watch for autonomic signs**

osttraumatic stress disorder (PTSD) is underdiagnosed among combat-exposed individuals and overdiagnosed among civilians. An expanded, nondichotomous checklist of emotional and physical signs following a disaster may help address this problem.

### PTSD diagnostic criteria shortcomings

Schnurr et al calculated that DSM-IV-TR diagnostic criteria A1 and A2 for PTSD together have a 34% positive predictive value when applied to victims of violent crime. Many who meet these criteria may not need intervention, and some interventions—such as critical incident stress debriefing—may be detrimental.<sup>2,3</sup>

DSM-IV criteria A1 and A2 do not take into account common peritraumatic autonomic activation signs—shortness of breath, tremulousness, racing heart, and sweaty palms/cold sweat—that are part of the human hardwired acute response to

threat.<sup>4</sup> Last year we published a research checklist of criteria A1 and A2 symptoms plus the four autonomic signs, which we collectively refer to as "criterion A3."<sup>4</sup>

A preliminary (tentatively weighted) clinical version of this checklist, the PTSD Criterion A3 Checklist (*Table, page 43*), may be useful for screening persons in the acute aftermath of a disaster. While more research is needed, this version is:

**Fear-specific.** The checklist includes queries about two peritraumatic, fear-specific signs (tremulousness and sweaty palms/cold sweat) as well as peritraumatic tachycardia and dyspnea.

**Brief.** This tool takes as little as 2 minutes to administer, thus minimizing the burden on victims in the days or weeks after a mass disaster.

**Non-dichotomous but easy to score.** One point is scored for each "Yes" answer for 8 of the 10 queries; "Yes" answers to the two other queries are worth 4 and 3 points, respectively. A total score of 5 or more may indicate a need for preventive intervention such as propranolol, 40 mg tid or qid for 7 to 10 days.<sup>5,6</sup>

**Minimizes stigma.** Assessing peritraumatic physical signs may help minimize stigma-related bias. This is important when screening persons likely to underreport criterion A2 symptoms, including:

- veterans
- military personnel
- firefighters
- police officers
- men in general
- persons from ethnic cultures in which having psychiatric symptoms is viewed as disgraceful.

**Easy to remember.** After a few administrations, the queries can be easily memorized and incorporat-

# PTSD Criterion A3 Checklist

Incident: Time since incident:			Total score* (0-15):
At the time, did you		Points for "Yes" answers	
Think	That you would be seriously physically injured or killed?	4	Total A1 score:
Criterion A1	That a close family member would be seriously physically injured or killed?	3	
	That someone else would be killed?	1	
Feel	Intense fear or fright?	1	Total
Criterion A2	Helpless?	1	A2 score:
	Horrified?	1	
Experience	Shortness of breath?	1	Total
Criterion A3	Trembling, shaking or buckling knees?	1	A3 score:
(Proposed for DSM-V)	Racing/pounding heart?	1	
	Sweaty palms or other cold sweat?	1	

ed into initial assessments. The four acute autonomic activation signs can be remembered with the acronym "STRS" (shortness of breath, trembling, racing heart, sweaty palms). Consider "A3" a mnemonic for "acute autonomic activation."
